SiteCourier™

Innovative system for delivering and retrieving safety resources during a turnaround.

United Safety has pioneered a safety resource delivery system that eliminates the significant lost tool time per shift that workers incur fetching and returning safety equipment. We bring it to them as they need it, and we fetch it back when the job is finished.

For both planned requirements determined prior to start of task set-up, and unplanned requirements called-in, equipment is delivered and rigged-in by qualified personnel. Once a job is completed a call to dispatch results in the same equipment being rigged-out and managed by the same personnel. Returned equipment is delivered to our mobile on-site QA/QC facility where it undergoes a complete field maintenance cycle; it is cleaned, disinfected, inspected and tested before being re-deployed. This added value allows equipment to be used multiple times per shift reducing overall project inventory requirements.

Constant Communication

A direct benefit of the SiteCourier™ is the constant communication with user groups it affords for the coordination of what, when and where equipment and personnel is needed. Instead of visiting a distribution trailer on the other side of the site to retrieve necessary equipment, craft labor go directly to work site where safety resources are waiting. Critically the system gives real-time monitoring and reporting of resources available to respond to ongoing
or emergency requests.

The United Safety Difference

Safety equipment (and personnel) is ready to go. The SiteCourier™ allows for the re-issue of equipment multiple times per shift reducing overall strain on inventory/supply. We also incorporate our safety specialists into our SiteCourier™ to ensure mitigation of work stoppages caused by equipment and or safety personnel not being at the right place at the right time.
