Enhance overall turnaround efficiency through onsite safety shops

Safety shops across the worksite stock required safety inventory in ready-to-use condition resulting in smoother workflows.

The client, a large Oil and Gas multinational, had a planned turnaround coming up. To maximize efficiency, the client wanted to ensure that workers had uninterrupted access to the safety equipment they needed. To keep costs in control, inventory needed to be accurately tracked, monitored, serviced and billed on a daily basis.

Challenge

To ensure workers have easy and prompt access to the equipment they need, reducing lost tool time. Inventory also needed to be effectively tracked and monitored for accurate daily usage reports and billing.

Solution

12 safety shops set up across the turnaround site to enhance efficiency and easy access to required tools. All inventory was tracked and monitored with daily billing and usage reports sent to the client.

Results

Lower lost tool time.
Efficient equipment tracking.
Accurate daily billing and usage reports.

Key Benefits

12 onsite safety shops

To avoid bottle necks and queuing, a geographical assessment was made at the very beginning and 12 locations were chosen for onsite safety shops. These shops were stocked with equipment required for the work going on in their work premises.

Onsite equipment servicing

The safety shops also ensured that all equipment returned was immediately put through a QA/QC cycle to ensure that the equipment was promptly cleaned, serviced and ready to be rented again. This reduced inventory costs through quicker equipment turnarounds.

Reduced number of missing inventory

All equipment was tagged and effectively tracked. Missing or unreturned equipment was easily flagged.

Effective inventory management

Depending on the job taking place within a certain area, inventory could be moved from one shop to the other to maximize inventory without needing to order new inventory.

Accurate daily billing

Daily reports were prepared for clients at the end of the work-day so they had a clear overview of equipment usage, equipment not returned and daily costs. The process was transparent, effective and had no hidden costs.
